

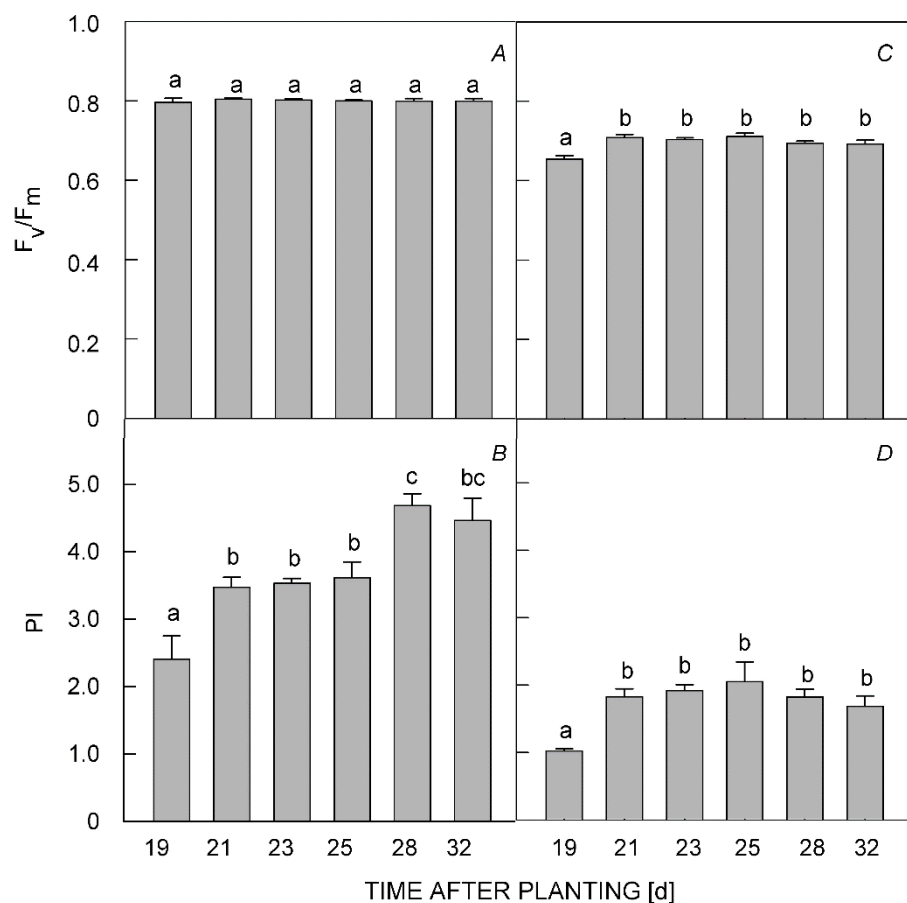

Fig. 1S. The maximal quantum yield of PSII photochemistry (F_v/F_m , A and C) and performance index (PI, B and D) in the attached second leaves of winter wheat seedlings *Triticum aestivum* cv. Jing 411 at 19–32 days after planting subjected to 1,000 $\mu\text{mol m}^{-2} \text{s}^{-1}$ PPFD for 0 h (A and B) and 1 h (C and D). Data were represented as mean $\pm$ SE ($n = 6$). Mean values indicated by *different letters* are significantly different at $P < 0.05$ according to LSD test.
